ENGINEERING

At **ITK Engineering**, we work together on customer-specific development projects in the areas of software development, embedded systems and control systems. Renowned customers from the automotive, agricultural technology and the construction, rail, medical technology and motorsports industries rely on our team when it comes to technologically advanced engineering services.

More than 1200 employees, mainly engineers, computer scientists and natural scientists work on the technology of tomorrow to bring “intelligence into machines”. At **ITK**, we use our expertise and experience from more than 26 years of consulting service projects to focus on the areas of test automation and e-mobility as well as developing safety-related software. Since 2017 we are a subsidiary of the Robert Bosch GmbH.

At **DEQ**, our motto is: “bring them home safe”, i.e. we want to support our project partners in improving the safety of the machines in such a way that not only an even safer automation can be achieved, but one that also generates significant economic benefits. The main aim is to use intelligent algorithms, innovative architectures and reliable sensors to make human-machine interaction even safer.
